

ALPACA AI TRADING AGENTS HACKATHON

Dark Wolf Sentinel

AI market intelligence with deterministic risk authority—and zero execution in the demo.

GPT-5.6 proposes • deterministic code decides • Alpaca PAPER only

LOCAL JUDGE-READY PITCH / ORGANIZER ELIGIBILITY CLARIFICATION PENDING

A useful market opinion is not permission to trade

AI can synthesize context quickly.
Portfolio effects still demand deterministic control.

Sentinel separates three jobs that are often collapsed into one agent loop:

01 Interpret market context

Price, trend, volume and news form evidence—not authority.

02 Propose a bounded thesis

GPT-5.6 may return PASS, BUY or BEARISH—but no quantity.

03 Control every capital effect

Deterministic code owns risk, execution gates and reconciliation.

The system is designed to fail closed—not improvise around a missing safeguard.

Sentinel turns raw context into a bounded decision

One analysis cycle, five explicit handoffs

VISIBLE OUTCOME

Judges can inspect the opportunity, model proposal, deterministic response and every disabled authority field.

Alpaca supplies context; GPT-5.6 proposes; code decides

The integration boundary is explicit at every step

OpenAI Responses API • pinned MCP compatibility • Alpaca PAPER clients

Intelligence is intentionally separated from effect

GPT-5.6 MAY

Analyze context
Return PASS / BUY / BEARISH
Explain thesis and invalidation

No quantity. No allocation. No order instruction.

MUST REMAIN FALSE

LIVE TRADING	FALSE
--------------	-------

BROKER SUBMISSION	FALSE
-------------------	-------

AI EXECUTION AUTHORITY	FALSE
------------------------	-------

MCP TRADING TOOLS	FALSE
-------------------	-------

FINAL AUTHORITY → deterministic portfolio-risk code

The demo proves a safe analysis cycle—not a trade

Existing local dashboard example; market output varies by run

1 Preflight

PAPER account flat; both execution flags false.

2 Run one cycle

IEX scan → MCP news → GPT-5.6 proposal.

3 Read the decision

PASS is a valid, successful no-trade result.

4 Verify zero authority

Every execution, submission and authority field is false.

Expected close: OPTIONS SUBMITTED False • BROKER SUBMITTED False • PAPER EXECUTION False • AI AUTHORITY False

Verification is part of the product

187

deterministic tests passed

One dependency deprecation warning; no test failures.

10 / 10

focused MCP tests

PASS

LIVE-trading + authority safety scan

PASS

public-candidate secret audit

PASS

safe flags + zero-authority artifact

Evidence covers behavior, safety boundaries, public-repo hygiene and reproducible commands—not profitability.

Pre-event and event-period work are disclosed separately

AUGUST 28 KICKOFF

BEFORE KICKOFF

Working prototype baseline

- Alpaca PAPER connectivity + IEX scanner
- Deterministic ranking and risk authority
- OpenAI proposal layer
- Controlled PAPER execution proof + reconciliation
- Read-only MCP news, dashboard and safety tests

Must not be represented as event-created work.

EVENT PERIOD

Bounded options + submission hardening

- Deterministic options vertical risk kernel
- Read-only chain selection and options shadow
- Inert MLEG intents and lifecycle state
- Disabled execution gate, durable state and recovery
- Explicit thesis expiration
- MCP compatibility pin + judge-facing documentation

Organizer eligibility clarification is pending.

DARK WOLF SENTINEL

AI market intelligence. Deterministic authority. Zero execution.

A transparent way to demonstrate agentic trading research while keeping every capital effect explicit, inspectable and disabled.

NEXT SAFE STEPS

1 Organizer ruling → 2 Clean-clone verification → 3 Public submission work only if approved

Execution stays disabled throughout.
